

Install Homebridge on Windows 10

oznu edited this page on Jan 21 · [8 revisions](#)

This guide provides step-by-step instructions to show you how to install Homebridge on Windows 10 as a service so it will automatically start on boot.

- [Prerequisites](#)
- [Install Homebridge](#)
 - [Step 1: Install Node.js](#)
 - [Step 2: Install Homebridge](#)
 - [Step 3: Setup Homebridge as a Service](#)
- [Manage and Configure Homebridge](#)
 - [With the Homebridge Config UI X plugin](#)
 - [Using the command line](#)
- [How To Uninstall Homebridge](#)
- [Multiple Instances](#)
- [Additional Utilities](#)
- [Configuration Reference](#)

Prerequisites

Before you get started, make sure you have the following ready:

- A computer running an update-to-date version of Windows 10 (this guide is based on 1903).
- An account with Administrator Privileges.

Install Homebridge

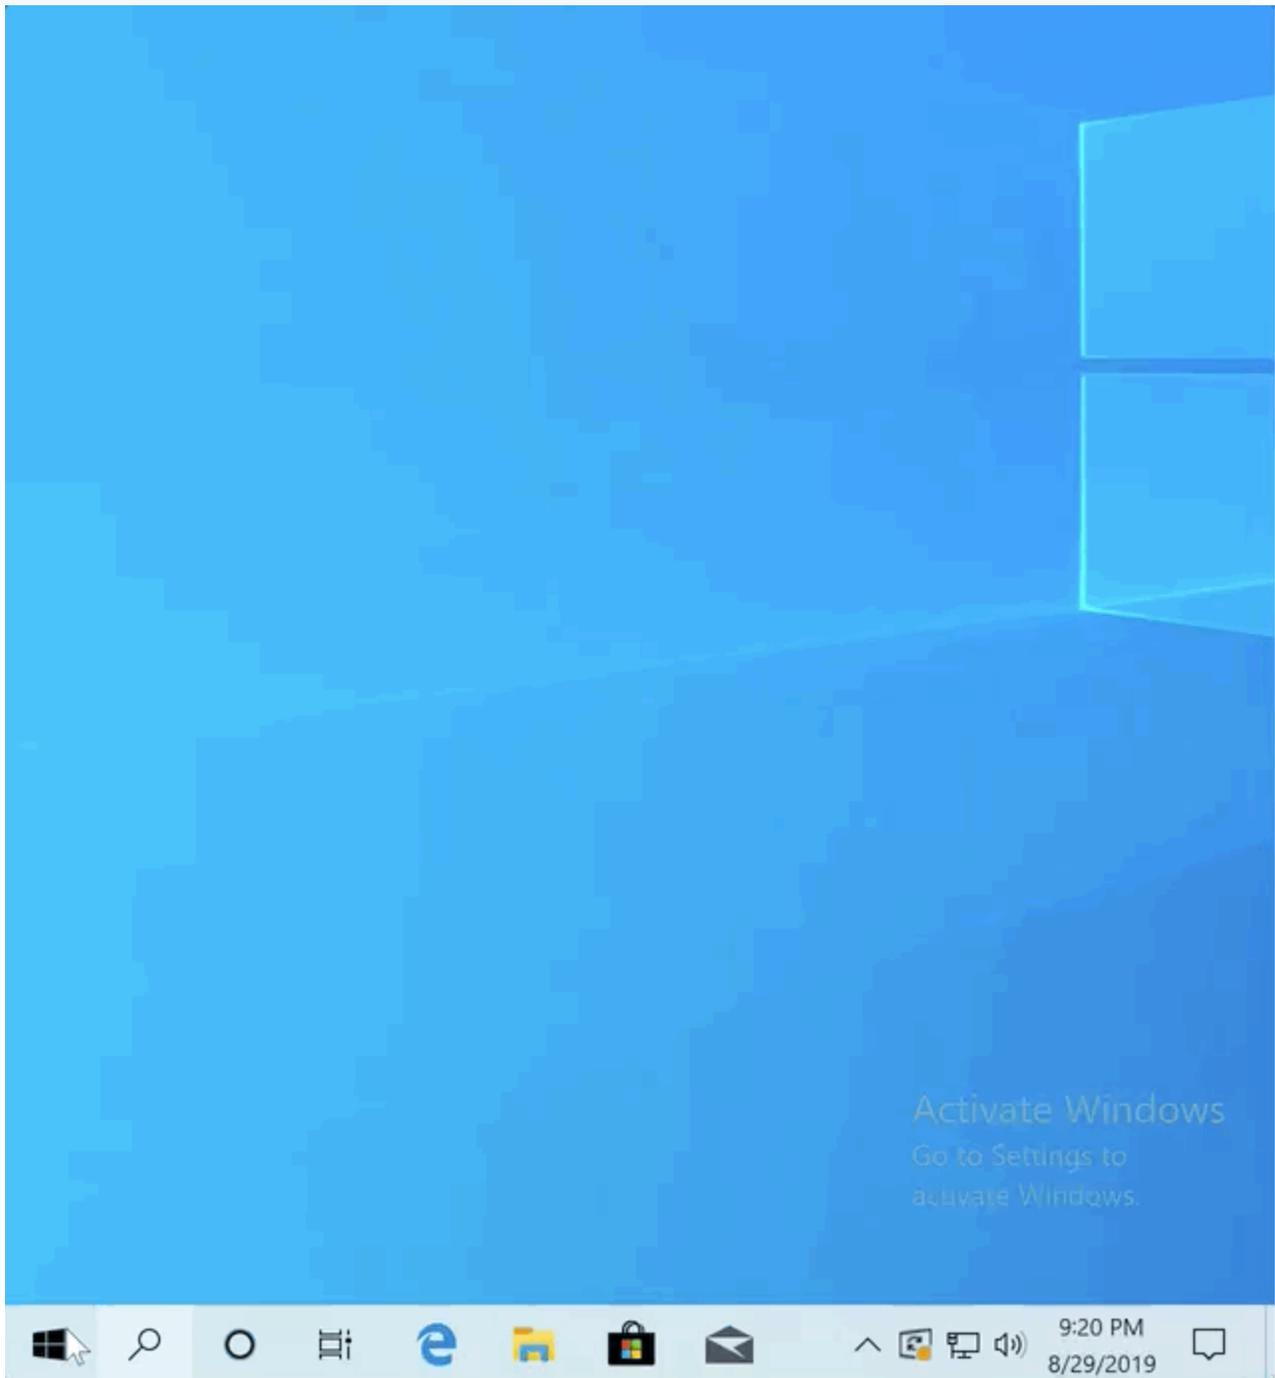

Step 1: Install Node.js

Download Node.js from <https://nodejs.org/en/download/> and run the installer with all the default options selected.

Open a new **Node.js Command Prompt** window as administrator, then check that Node.js and NPM have installed correctly by running the following commands:

```
# test node.js is working
node -v

# test npm is working
npm -v
```

Step 2: Install Homebridge

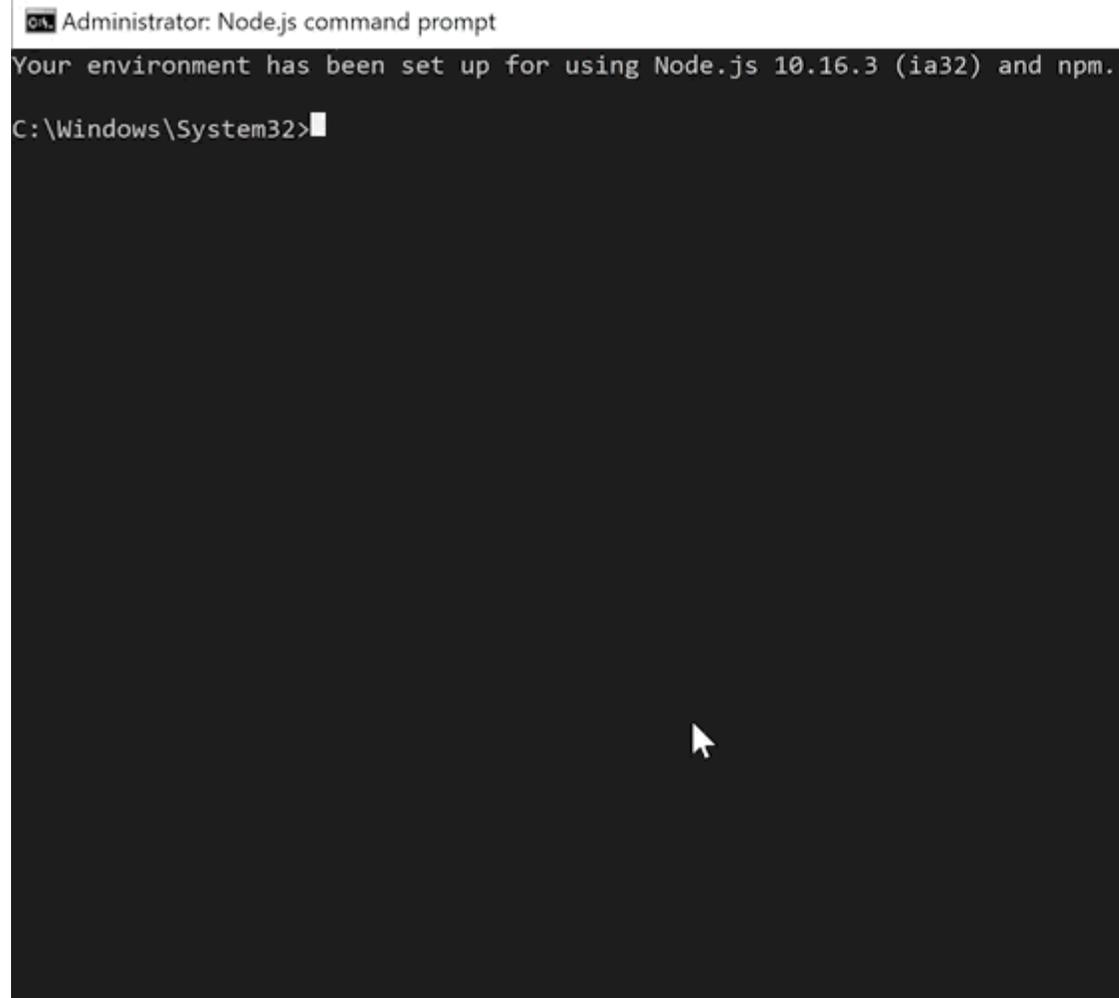

From the administrator Node.js command prompt, run the following command to install Homebridge and [Homebridge Config UI X](#):

```
npm install -g --unsafe-perm homebridge homebridge-config-ui-x
```

Step 3: Setup Homebridge as a Service

To install Homebridge as a service we use the hb-service command provided by the [Homebridge Config UI X](#) plugin:

```
hb-service install
```

The screenshot shows a Windows command prompt window titled "Administrator: Node.js command prompt". The text inside the window reads: "Your environment has been set up for using Node.js 10.16.3 (ia32) and npm." followed by the command prompt "C:\Windows\System32>". A mouse cursor is visible at the bottom center of the window.

If you see a Windows Firewall warning, make sure you grant Node.js permissions to access your private network.

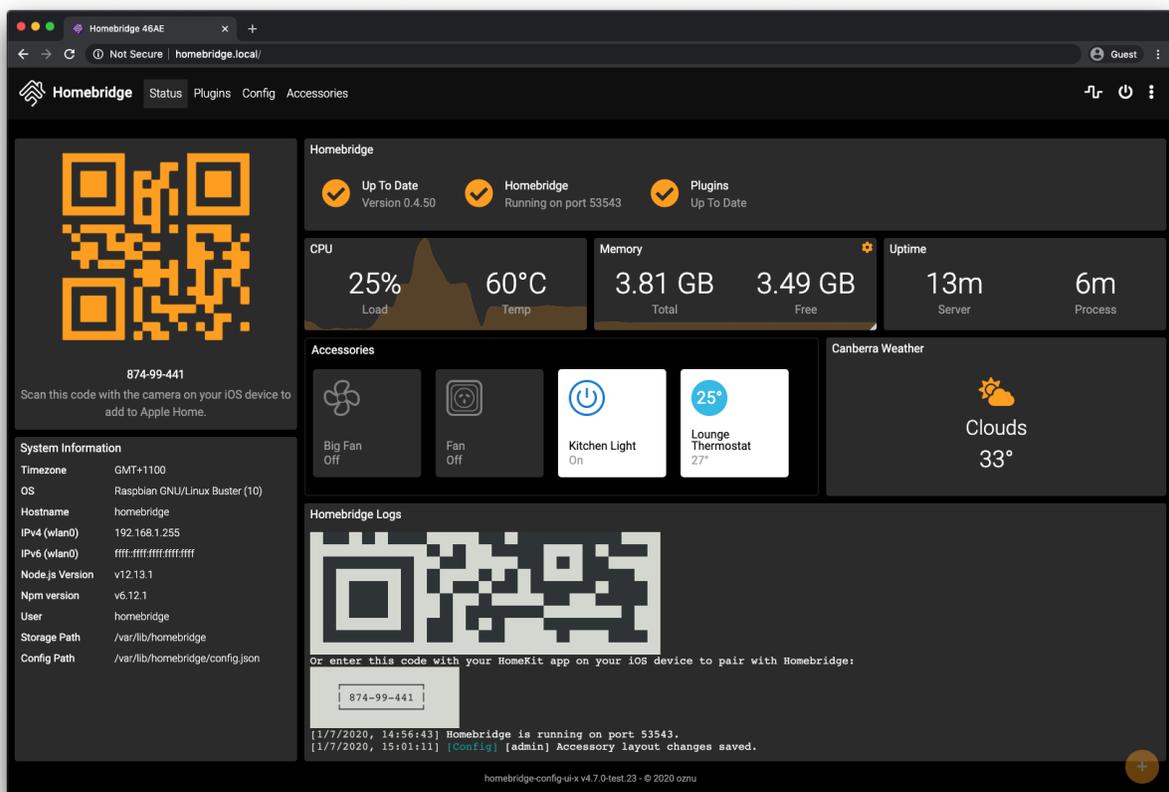

Manage and Configure Homebridge

With the Homebridge Config UI X plugin

The [Homebridge Config UI X](#) will allow you to install, remove and update plugins, and modify the Homebridge config.json.

To access the UI go to `http://localhost:8581` in your browser.

The default username is **admin** with password **admin**.

Review the [Configuration Reference](#) at the bottom of this guide.

Using the command line

To view your pairing QR code, you'll need to view the logs which are stored in the `$HOME\.homebridge\homebridge.log` file. You can view the from a Node.js command prompt with this command:

```
hb-service logs
```

To edit your `config.json` file you can open the `$HOME\.homebridge\config.json` file in a code editor of your choosing ([VS Code](#) is a good option with syntax checking).

Do not edit the `config.json` file using the a word processor that does text formatting as this will corrupt the file.

After making any changes to your `config.json` you need to restart Homebridge using by stopping and starting the service in Task Manager. You can also run this command from a Node.js command prompt:

```
hb-service stop
hb-service start
```

How To Uninstall Homebridge

Delete the service run the following command from a Node.js administrator command prompt:

```
hb-service uninstall
```

Remove Homebridge and Homebridge Config UI X:

```
npm uninstall -g homebridge homebridge-config-ui-x
```

You can optionally delete all Homebridge data stored in `$HOME\.homebridge` and uninstall Node.js.

Multiple Instances

Some users like to run multiple instances of Homebridge.

The `hb-service` command makes this easy to do via the `--service-name` flag.

[See the `hb-service` documentation for instructions.](#)

Additional Utilities

Some plugins may require you to have [git](#) installed, or the [windows-build-tools](#) to compile native modules.

git

While installing certain plugins you may encounter the `spawn git ENOENT` or `ENOGIT` error. To resolve this issue you need to install the `git` utility. You can download the installer from <https://git-scm.com/downloads>.

windows-build-tools

The `windows-build-tools` allow Homebridge plugins to compile native code for your platform. While increasingly rare, some plugins will require this. To install the `windows-build-tools` open a **Node.js command prompt as an Administrator** and run:

```
npm install --global windows-build-tools
```

This command can take a very long time to run. Be patient.

Configuration Reference

This table contains important information about your setup. You can use the information provided here as a reference when configuring or troubleshooting your environment after setting up Homebridge using the instructions below.

	File Location / Command
Config File Path	%HOMEPATH%\homebridge\config.json
Storage Path	%HOMEPATH%\homebridge
Restart Command	hb-service restart
Stop Command	hb-service stop
Start Command	hb-service start
View Logs Command	hb-sericce logs
